

# Curriculum vitae

## Persoonsgegevens:

Naam : Maikel Boezer  
Voorletters : M.M.J  
Geb. datum : 4 November 2003  
Geslacht : M  
Gehuwd : Nee  
Adres : Nieuwe Zandschel 4  
Postcode & woonplaats : 5171TN Kaatsheuvel  
E-mailadres : mboezer@ziggo.nl  
Telefoonnummer : 06-37607068  
Nationaliteit : Nederlands  
Rijbewijs : B

## Opleidingen:

| Periode     | Opleiding                                              | Diploma       |
|-------------|--------------------------------------------------------|---------------|
| 2025 – 2026 | Applied data science and artificial intelligence (HBO) | Ja            |
| 2022 – 2026 | Minor CyberStars: cybersecurity.                       | Certificaat   |
| 2020 – 2022 | Natuur en techniek (Havo)                              | Ja            |
| 2020 – 2020 | Python beginner course Radboud Nijmegen                | Plus document |
| 2020 – 2020 | Kennismaking robotica hogeschool Utrecht               | Plus document |
| 2016 – 2020 | Natuur en techniek (Mavo)                              | Ja            |

## Nadere omschrijving van de opleiding(en):

Opleiding : Breda University of Applied Science (BUas)  
Periode : 2022-2026  
*Diploma / certificaat* : Diploma gehaald

Opleiding : Willem van Oranje college waalwijk (Havo)  
Periode : 2020-2022  
*Diploma / certificaat* : Ja

Opleiding : Willem van Oranje college waalwijk (Mavo)  
Periode : 2016-2020  
*Diploma / certificaat* : Ja, cum-laude geslaagd

## Werkervaring:

| Periode     | Functie                                                 | Bedrijf               |
|-------------|---------------------------------------------------------|-----------------------|
| 2026 – now  | Parttime junior data-engineer                           | PlaySmart/BUas        |
| 2026 – 2026 | Data engineer (afstudeeropdracht)                       | Breda Guardians/ BUas |
| 2025 – 2025 | Data engineer & analytics translator                    | Stedin                |
| 2024 – 2025 | Data engineer (opdracht tijdens studie)                 | Breda Guardians/ BUas |
| 2023 – 2024 | Data engineer (opdracht tijdens studie)                 | NPEC Utrecht/ BUas    |
| 2023 – 2024 | Data scientist (opdracht tijdens studie)                | Banijay benelux       |
| 2023 – 2024 | Data engineer/ Data scientist (opdracht tijdens studie) | NPEC Utrecht          |
| 2023 – 2024 | Reseurser (opdracht tijdens studie)                     | BUas                  |
| 2022 – 2023 | Data engineer (opdracht tijdens studie)                 | gemeente Breda        |
| 2022 – 2023 | Data scientist (opdracht tijdens studie)                | Banijay benelux       |
| 2019 – 2019 | Snuffelstage IT dienst verlening                        | ReallyIT              |

## Taalvaardigheden:

| Talen      | Schriftelijk | Mondeling |
|------------|--------------|-----------|
| Nederlands | goed         | goed      |
| Engels     | goed         | goed      |

**De opleiding is Engelstalig vandaar dat de uitleg over mijn skills en projecten in het engels is.**

## **Skills and software skills:**

- I have 4 years of experience with Python in these years I have made
  - Machine learning models
  - deep learning models
  - neural networks
  - computer vision(cv) models
  - Natural language processing (NLP) models
- I know how to work with Docker and prepare them to put on a server.
- I have worked with PowerBI to create dashboards for clients.
- I have automated a pipeline from data downloading to data visualization on a dashboard.
- I have set up branching strategies for a research project

## **My projects:**

### **Graduation project:**

**More details about all the projects can be found on my portfolio [website](#).**

### **Research Manager & DevOps Lead — The Hive, Breda Guardians (BUas) (Feb 2026 - Jun 2026)**

- Migrated a multi-institutional esports analytics toolkit (Play-Smart) from manual, USB-based deployment to a version-controlled, containerized GitHub Actions workflow, coordinating contributions across BUas, Tilburg University, and the University of Twente
- Designed a hybrid branching strategy (institutional forking model + Git-Flow/GitHub-Flow) letting partner institutions work independently while keeping merge control centralized
- Containerized the toolkit into a 5-service Docker stack (frontend, backend, data pipeline, inference, SFTP) and built a CI/CD pipeline that detects the changed service on each merge and rebuilds/redeploys only that container via a self-hosted GitHub Actions runner
- Designed and ran a within-subjects usability study (n=4) using the Technology Acceptance Model, DORA, and SPACE frameworks, measuring a 2-4x reduction in deployment time (8-12 min vs. 22-33 min) and unanimous preference for the new workflow
- Documented findings and limitations to guide adoption as the toolkit's standard deployment process going forward

### **Data & Analytics Intern — Stedin (Oct 2024 - Jan 2025)**

- Built a Power BI dashboard to monitor green gas quality across 12 feeder locations for Stedin's green gas department, tracking O<sub>2</sub>, CO<sub>2</sub>, water dew point, pressure, H<sub>2</sub>S, and Wobbe index against regulatory thresholds
- Automated the end-to-end data pipeline using Python-based RPA (since the vendor's API didn't support the required data format), replacing a manual process that took 15-30 minutes per location with reports Stedin previously received only every 6 months from a third party
- Performed EDA and data cleaning across multi-location time-series data, identifying and resolving data quality issues (e.g., inconsistent pressure units at one site, systemic missing H<sub>2</sub>S data at others caused by a vendor's non-standard recording interval)
- Reverse-engineered a complex Excel-based "Wobbe index" visualization and rebuilt it as a custom Python visual embedded in Power BI, translating spreadsheet formula logic into equivalent Python calculations

- Deployed the solution as a standalone executable integrated with SharePoint, enabling non-technical supervisors to refresh data without manual intervention
- Validated the dashboard through user testing with a Stedin colleague and presented it to a group of external gas providers, gathering feedback that shaped further iterations

### **Data Engineer & Analytics Translator — The Hive, Breda Guardians (BUas) (2024)**

- Built the first end-to-end data pipeline for a multi-year esports analytics project as part of the founding student cohort, with no existing infrastructure to build on
- Engineered a multi-modal data collection pipeline capturing keyboard/mouse input, Tobii eye-tracker gaze data, webcam-based facial emotion recognition (via OpenFace), and OBS video capture
- Designed a dual-storage architecture (SFTP for bulk files, PostgreSQL for structured/queryable data), containerized in Docker for reliable, repeatable deployment on shared infrastructure
- Automated the pipeline so that ending a data collection session triggers automatic upload to SFTP and PostgreSQL, feeding a live progress dashboard with zero manual handling
- Scoped the project's original "AI coach" ambition down to a realistic, reusable foundation, enabling subsequent cohorts to build analytics directly on top of the pipeline

### **Data Scientist — NPEC Utrecht / BUas (2023-2024)**

- Built a computer vision pipeline using U-Net image segmentation to isolate plant roots from raw camera images for an autonomous plant-watering system
- Applied image skeletonization to reduce segmented roots to single-pixel-wide lines, enabling precise extraction of root-tip coordinates and main root length
- Delivered an end-to-end pipeline from raw image to root-length measurement, meeting NPEC researchers' requirement for tracking plant growth over time
- Validated the approach with a working robot-arm simulation targeting the extracted coordinates, scoping full watering automation as next-stage work
